

# react-router vs react-router-dom

Sección 11, Clase 180

We installed both `react-router` and `react-router-dom`.  
**Technically, only `react-router-dom` is required for web development.** It wraps `react-router` and therefore uses it as a dependency.

We **don't need to install** `react-router` on our own for it to work. You can omit this installation step, I left it in there for historic reasons and because I like to emphasize that the main package is named `react-router`. If you ever search for assistance, you probably want to search for "react router" - that's the name of the package.
