React 16.2 Feature: Fragments
Sección 7, Clase 94

If your project uses **React 16.2**, you can now use a built-in "Aux" component - a so called **fragment**.

It's actually not called `Aux` but you simply use `<>` - an empty JSX tag.

So the following code

```
1    <Aux>
2        <h1>First Element</h1>
3        <h1>Second Element</h1>
4    </Aux>
```

becomes

```
1    <>
2        <h1>First Element</h1>
3        <h1>Second Element</h1>
4    </>
```

Behind the scenes, it does the same our `Aux` component did.
